Workshop on "Data Structure and Problem Solving for interviews"' 2020

On 24th June 2020, Wednesday. Coding Blocks collaborated with Department of Computer Science & Applications, Panjab University to host a workshop on Data Structures- Graphs. The session was conducted by Mr. Apaar, Coding Blocks.

About the event:

Online webinar dated 24 June 2020 with mentor Mr. *Apaar* was centred about Data Structures- Graphs. In total 92 students from the department attended the online workshop.

Under the vast topic of Data structures graphs Mr Kamal introduced students with the bellman ford algorithm. He explained each and every step of the algorithm along with little interesting facts about the algorithm.

The Bellman-Ford algorithm is a graph search algorithm that finds the shortest path between a given source vertex and all other vertices in the graph. This algorithm can be used on both weighted and unweighted graphs. This algorithm in data structures graph is very effective for some real-life applications for example calculating shortest path for both weighted and non-weighted graphs, converting multiple currencies, selecting edge weight and finding negative weight cycle. Bellman ford algorithm is considered as a very important algorithm.
Following mentioned topics related to Data Structure Graph were discussed:

- Bellman-Ford Algorithm
- Detecting negative cycles
- Directed Graphs
- Single source shortest path
- Relaxation of Edges
- Order of Algorithm
- Negative Weight Edges
- Dijkstra Algorithm
- Comparison of Dijkstra Algorithm with Bellman-Ford
- Cases where Dijkstra Algorithm fails]

The session delivered was very informative and the above mentioned topics were discussed in very detail and doubts from the students were

solved side by side. A link to access the e-certificate was provided at the last of the session. It was a great experience to be a part of the webinar.
